PROFILE

Bachelor of Science in Engineering in Computer Engineering and Business from KTH (2026). During my degree project at Epinova, I built and deployed Archivon - a distributed, RAG-based multi-agent system in .NET that automates technical documentation, with a full CI/CD pipeline on Azure. I am now seeking an AI Developer role where I can build solutions that deliver real-world value.

EXPERIENCE

Degree Project - AI Development | Epinova AB (in collaboration with KTH) 2025 - 2026

Built Archivon from the ground up: a RAG-based multi-agent system for automated, persona-driven documentation generation.

- Architecture comprising two .NET 10 microservices exposed through MCP with SSE streaming, integrated with the Optimizely Opal SDK.
- RAG pipeline using Azure OpenAI embeddings, pgvector in PostgreSQL, and cosine-similarity retrieval.
- Custom-built connectors for GitHub (pull requests and commits) and Azure DevOps (user stories), together with prompt-injection defenses.
- Outcome: Delivered and demonstrated live to Epinova Norway; the system runs in production on active client projects and generates sprint summaries, gap analyses, and developer documentation that was previously written manually. Recognized at group and CIO level as a potential product.

Technologies: C# .NET 10, PostgreSQL, pgvector, Azure OpenAI, Azure App Service, GitHub Actions, MCP/SSE, RAG, Optimizely Opal SDK

Wait App - Admin Dashboard for Patient Data | Karolinska Institutet x KTH 2024

- Full-stack solution built with React (TypeScript) and Quarkus backed by PostgreSQL, featuring real-time patient-data visualization and secure authentication through Keycloak.
- Delivered a working admin dashboard to Karolinska Institutet and provided healthcare staff with a real-time overview of patient flow.

Technologies: React (TypeScript), Java, Quarkus, PostgreSQL, Docker, Keycloak, Jest

Ball Brawl - Networked 2D Multiplayer Game | KTH 2023

- Real-time network game for up to four players; responsible for TCP/IP communication, game logic, and physics using an MVC architecture in C/SDL2.
- Outcome: Completed, playable networked game that ran reliably with four concurrent players.

Technologies: C, SDL2, SDL_net, TCP/IP, MVC, Scrum

Personal Assistant | Humana AB 2018 - Present

Picker and Packer | Zalando 2021 - 2022

IT Technician | Computer Engineering Company 2013 - 2015

EDUCATION

BSc in Engineering - Computer Engineering and Business | KTH Royal Institute of Technology 2022 - 2026

- Relevant coursework: Machine Learning, Algorithms and Data Structures, Databases, Software Development, Economics, and Business Development.

TECHNICAL SKILLS

AI & ML: RAG pipelines, LLM integration (Azure OpenAI), embeddings, vector databases (pgvector), prompt engineering, multi-agent systems, MCP

Backend: C# .NET 10, Java (Quarkus), REST APIs, microservices, SSE streaming

Programming: C#, Java, Python, TypeScript, JavaScript, C, Assembly, VHDL

Databases: PostgreSQL, pgvector, MySQL, MongoDB

Cloud & DevOps: Azure (App Service, OpenAI, DevOps, PostgreSQL), GitHub Actions, Docker, CI/CD

Web & Tools: React, HTML/CSS, Figma, Keycloak, Jest, Scrum/Agile

Languages: Swedish - fluent, English - fluent, Arabic - native
